

BrandGuard Prompt Library: Master Plan for Knowledge File Generation

1. Strategic Purpose

The goal is to replicate the moment in the mid-1990s when companies first realized they needed a domain name and basic website presence—but this time, for the **AI ecosystem**. Each BrandGuard GPT acts as an early digital land claim: a self-contained AI presence that embodies, protects, and expands a company's brand gravity. The prompt library serves as a **factory of knowledge files** powering those GPTs.

2. Objective

Create **12–16 structured knowledge files** per BrandGuard GPT (11 total brands) — each file between **8 and 30 pages** in Markdown format, formatted for **machine readability** and ready for ingestion into the GPT Builder or external RAG pipelines.

Each file acts as a modular tile of intelligence: deeply researched, citation-rich, and architected for autonomous reasoning.

3. Universal Prompt Structure

Each prompt is built from five consistent parts to maximize clarity and automation:

1. Role Definition

Example: *"You are a corporate history and product intelligence content agent for [Brand]."*

2. Output Format

Output: **Markdown**, machine-readable, with explicit front matter and section headers.

3. Front Matter Template

```
---
title: "[TOPIC TITLE]"
version: "1.0"
topic_key: "[short_topic_key]"
date: "[YYYY-MM-DD]"
---
```

4. Section Blueprint (Reusable Skeleton)

5. **Introduction & Context**
6. **Company History & Founding Narrative**
7. **Brand Identity & Product Portfolio**
8. **Market Position & Competitive Landscape**
9. **Financial and Stock Overview (if applicable)**
10. **Major Disruptions / Industry Impact**
11. **Sustainability, Innovation & Future Strategy (SCAMPER applied)**
12. **Potential Headwinds and Resilience Planning**
13. **Likely User Questions**
14. **Related Topics / Crosslinks**
15. **Reasoning Techniques to Embed**
16. **CoT (Chain of Thought):** For causal explanations (e.g., why brand shifts occur).
17. **ToT (Tree of Thought):** For branching competitive or scenario analysis.
18. **SoT (Stream/Sketch of Thought):** For concept generation, naming, and product taxonomy.
19. **SCAMPER:** For innovation analysis (Substitute, Combine, Adapt, Modify, Put to another use, Eliminate, Reverse).

Each reasoning technique provides scaffolding for the AI to reason methodically while maintaining structural discipline.

4. Knowledge File Categories per Brand

Each BrandGuard GPT receives 12–16 prompts corresponding to a balanced taxonomy of knowledge:

1. **Founding & Corporate History**
2. **Mission, Vision, & Brand Philosophy**
3. **Product Lines / Services**
4. **Consumer Demographics & Market Reach**
5. **Financials / Ownership / Stock Performance**
6. **Sustainability & ESG Commitments**
7. **Innovations & Technologies**
8. **Partnerships & Acquisitions**

9. Marketing & Slogans (Cultural Analysis)
 10. Customer Experience & Loyalty Programs
 11. Challenges, Risks, & Industry Headwinds
 12. Competitive Positioning & Landscape
 13. Media Coverage & Public Perception (past 5 years)
 14. Future Outlook & Strategic Trends
 15. Product Identification & Comparison Module
 16. FAQ / Knowledge Recap File
-

5. Execution Framework

For each company, a **branched thread** will be created in Canvas to generate each knowledge file. Each thread uses the same prompt structure, dynamically populated with brand identifiers and relevant source references.

Execution Pattern per File:

1. Phase 1: Schema & Front Matter
2. Phase 2: Data Harvest (Browsing ON)
3. Phase 3: Draft Composition (Thinking ON, Canvas ON)
4. Phase 4: Validation & CanonSeal
5. Phase 5: Export (PDF or Markdown ingestion)

Output Validation Targets: - Length: 8–30 pages (approx. 4,000–18,000 words) - Format: CanonHeader YAML + Markdown body + CanonSeal summary - References: BFS-style public citations only

6. Long-Term Positioning

The goal is to show that these GPTs are not marketing toys, but **new acquisition channels** analogous to early domain names or paid search placements.

In 1995, brands needed domain names to be found on the web.

In 2025, they will need **Custom GPTs** to be found in the conversational economy.

By demonstrating knowledge density and brand integrity across 11 proof-of-concept GPTs, this project will serve as a wake-up call to corporations still asleep at the gate.

7. Next Steps

1. Generate the first **prompt bundle**: 12–16 topics for one prototype brand (e.g., *Starbucks: BrandGuard*).
2. Validate the output quality (length, citations, readability).
3. Replicate and adapt across the remaining 10 brands.
4. Create a final synthesis deck showing how each BrandGuard GPT acts as a **new organic + AI-driven customer funnel**, replacing the function of traditional paid search.

Deliverable Summary:

- 11 GPT ecosystems - 12-16 Markdown knowledge files each (132-176 total)
- 8-30 pages per file
- Fully formatted, citation-rich, RAG-ready
- Designed for autonomous ingestion into GPT Builder

This library becomes the **AI-age equivalent of corporate domain registration**: staking intellectual and conversational territory before competitors do.
